

**THC** ↑

**Marijuana today is different.**

Potency in 60's / 70s = 1 – 2%.

Now = 14 – 30 % THC in smoked form and 96 % in concentrates (dabs).

**There is no difference between marijuana and cannabis.**

Marijuana is slang and is most often used to describe the drug. Cannabis is the name of the plant that the drug comes from.

**Dabs / BHO (butane hash oil) / Wax / Shatter / Honey Oil**

A very potent marijuana concentrate made by dissolving the plant in a solvent, usually in a dangerous process using butane. There are over 9,000 videos online showing how to complete this process

**Vape pens and JUULs**

An increasingly popular method to smoke Dabs / BHO because they emit no smoke and no odor and can be used without detection.

**Edibles**

Growing in popularity as a way to consume the drug.

Almost any food product can be infused with marijuana and eaten.

**Edible Overdose**

Because food is absorbed into the blood stream edibles take 1 – 3 hours to feel the effects of the drug compared to only minutes through smoking. Because of this, there is an increased chance of consuming larger amounts of the drug. Overdose symptoms from edibles are more severe than overdoses symptoms from smoking.

**Spice / Synthetics / K2**

Herbs & spices sprayed with a synthetic compound chemically made to mimic THC. No part of synthetics come from the cannabis plant. Synthetics can be smoked or added to food and drinks.

**Not For Human Consumption**

Marketed as incense so FDA can't regulate it, synthetics are dangerous because components can vary and be unknown, side effects: hallucinations, vomiting, rapid heart rate, heart attack, psychotic and violent behavior, renal failure, anxiety, tremors, seizures, loss of consciousness, high blood pressure, and death.
